IN THE CLAIMS

Amend the claims as indicated below.

- 1.(Currently Amended) A medical system architecture, comprising: a modality for acquiring medical images,
- an image processor constructed and operable to process a means for processing the medical images, said image processor including means for processing includes a digital image system with a computer that works according to a standard for object linking and embedding method for data exchange between various application programs with graphical control elements and a standard for object linking and embedding custom controls, wherein a standard for object linking and embedding custom controls software component is allocated to every individual process limited by address space boundaries,
- a remote control component means for expanding the standard for object linking and embedding custom controls software components with a remote control component for asynchronous communication so that devices and processes can be remote controlled without any limitations caused by address space or computer boundaries,
- an application including three tiers, said three tiers including a view tier and a controller tier and at least one modeling tier, and
- <u>image</u> a means for the transmission <u>apparatus connected to transmit the medical</u> of the images [[,]] <u>.</u>
- 2. (Previously Presented) A medical system architecture according to claim 1, wherein said remote control component is an automation object communication interface.
- 3. (Currently Amended) A medical system architecture according to claim 2, wherein the remote control <u>component operates</u> ensues according to an automation object communication standard.
- 4. (Previously Presented) A medical system architecture according to claim 1, wherein the remote control component is an automated object interface component.

- 5. (Currently Amended) A medical system architecture according to claim 1, wherein the remote control component ensues with software-IC connections.
- 6.(Currently Amended) A medical system architecture according to claim 1, wherein the remote control <u>component operates</u> ensues according to the ATOMIC (Asynchronous Transport Optimizing observer-pattern-like system supporting several Modes for an Interface definition-less language Communication) system.
- 7. (Original) A medical system architecture according to claim 5, wherein the remote control component is a connectable/remote interface component.
- 8. (Original) A medical system architecture according to claim 6, wherein the remote control component is a connectable/remote interface component.
- 9. (Currently Amended) A medical system architecture according to claim 1, wherein said <u>image transmission apparatus</u> means for transmitting uses for data exchange the standard for object linking and embedding.

Claim 10. (Cancelled)

- 11. (Original) A medical system architecture according to claim 1, further comprising:
- means for use of software component technology for producing components for graphic user interfaces contained within a process.
- 12. (Original) A medical system architecture according to claim 1, further comprising:
- means for combining software component technology with standard for object linking and embedding Automation for distributed propagation of an event within a control level and between the control levels.
- 13. (Original) A medical system architecture according to claim 1, further comprising: means for combining software component technology with software-IC connections for the distributed propagation of an event within a control level and between the control levels.

- 14. (New) A medical system architecture as claimed in claim 1, wherein each of said three tiers are contained in different processes.
- 15. (New) A medical system architecture as claimed in claim 1, wherein said view and control tiers are in one process and said model tier is in another process.
- 16. (New) A medical system architecture as claimed in claim 1, wherein said model and control tiers are in one process and said view tier is in another process.
- 17. (New) A medical system architecture as claimed in claim 1, wherein said view and control and model tiers are in one process.
